                                                                                                                                                                                                                                                                                   Human pro-Yama (AAW00677) is a zymogen which upon activation cleaves PARP to an 85 kDa form. Activated Yama has the ability to modulate cellular function associated with the Fas receptor pathway such as Fas-associated apoptosis. This activity is inhibited by CrmA (see also AAW00678). The pro-Yama sequence was deduced from a cDNA clone isolated from human umbilical vein endothelial cells. Yama can be produced in a host cell and used to modulate cellular function, to raise antibodies, or to screen for agents or drugs which modulate
                                                                                                                                                                                                                                                         Sequence

                                                                                                                                                                                                                                                                                                                                   This ICE-LAP-4 protein may be used therapeutically, e.g. as an antitumor or antiviral agent and to control embryonic development and tissue homeostasis. The protein can also be used to treat immunosuppression disorders, such as AIDS, by targeting virus infected cells for cell death. The DNA may find use in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                         Human ICE-LAP-3 and -4 DNA and protein - useful in the diagnosis and treatment of Alzheimer's disease, Parkinson's disease, rheumatoid arthritis, septic shock and head injury
                                                                                                                                                                                                                                                                                                    Sequence

Controlling apoptosis by inhibiting activation of the U1-70 pathway - by introduction of nucleic acid encoding protein with CrmA biological activity into the cell

N-PSDB;

1998-056551/06 DB; AAV05471.

(UNMI) UNIV MICHIGAN

Disclosure; Fig 2; 48pp; Japanese.

designated YAMA. The specification describes a novel method of controlling cell functions controlled by the tumour necrosis factor receptor (TNF-R) pathway containing U1-70. The method comprises introducing a nucleic acid molecule encoding CrmA into a cell, and culturing the cell under suitable conditions for transcription and translation of the CrmA nucleic acid. Method for preventing and inhibiting apoptosis by inhibiting activation of the U1-70 path, identifying the chemical related to the apoptosis path, and screening candidate chemical having biological function in the apoptosis path ar also described. The methods can be used to identify substances which modulate apoptosis in cells controlled by the TNF-R pathway. are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                apopain. The PARP cleavage enzyme was purified from the human monocytic leukaemia cell line, THP-1, using standard ion exchange chromatography techniques and SDS PAGE. Apopain can be used to identify apopain activity modulators, while apopain encoding DNA may be used for apopain production or in gene therapy (i.e. in vivo or ex vivo gene transplantation) for enhancing the pro-inflammatory or pro-apoptotic effects of apopain. Anti-apopain antibodies and antisense DNA can be used to reduce or eliminate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10 gene products (AAY21715-Y21724).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases.
                                                                                                                                                                                                                                                                                                                   AAU05394 standard; Protein; 277

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence representing human caspase 3 is described in an invention relating to novel antisense oligonucleotides (AASI0517-AASI0676) and methods of using these compounds for the modulation of caspase 3 expression. The caspase 3 antisense oligonucleotides specifically hybridise with and inhibit the expression of caspase 3. Antisense compounds targeted to caspase 3 are useful to inhibit caspase 3 expression in cells or tissues and to modulate apoptosis. The caspase 3 antisense oligonucleotides are useful for treating disorders associated with expression of caspase 3. Such disorders include hyperproliferative disorders (e.g. cancer), viral infections (e.g. hepatitis), haematopoietic disorders, autoimmune viral infections (e.g. hepatitis), haematopoietic disorders, autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC CP932, yama and apopain. Caspases are a family of cysteine proteases, cc that participate in the initiation and execution of apoptosis. Caspases cc exist as pro-enzymes, activated by cleavage into a large and small closupartic aspuratic acid residues within the pro-enzyme sequence. The present invention relates to a method for cc functional cloning of genes encoding proteins or enzymes involved in cc pro-enzyme sequence. The invention is based on the use of caspase cc expression cassettes comprising the coding sequence of a proteolytic cleavage aite flanked by sequences encoding sequence of a proteolytic cleavage site flanked by sequences encoding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunit. A cc fusion polypeptide comprising a first and a second caspase subunit, and cc cloning gene encoding enzymes involved in proteolytic cleavage. An cc expression cassette containing fusion polypeptide is used to identify a cutant cell line deficient in an enzyme of interest and is also useful cc alignosis and suppression of proliferation or metastases of a tumour cell characterised by overexpression of a polypeptide (e.g. Cathepsin B course) in a metastase of a tumour coll characterised by overexpression of a polypeptide). The mutation affects the catalytic properties of the enzyme but does not affect their binding properties. The invention provides for new ligands for use in SPA which have increased binding affinity for a tyrosine phosphatase or cysteine protease. The ligands contain at least two 4-phosphono(difluoromethyl) phenylalanine groups which increase binding affinity of the ligand to its respective enzyme. The assay can be used to determine the ability of new ligands and compound mixtures to competitively bind with an enzyme. The method is claimed to allow a better usage of SPA in the discovery of compounds for the treatment and study of diseases, e.g. diabetes, cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a mutated human apopain (caspase-3) C163S pro-enzyme. The active enzyme containing P17 subunit (Ser29-Asp175) and P12 subunit (Ser176-His277) was engineered for expression using the MetSer29-Asp175 and MetSer176-His277 constructs. The invention claims for a method for use in a scintillation proximit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzyme binding assay for detection of useful compounds - uses mutant form of wild-type enzyme, in which serine replaces cysteine at active site, to reduce interference from oxidising/alkylating agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention claims for a method for use in a scintillation binding assay (SPA) for proteases and phosphatases. The method for the second protection of the second protect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Pages 39-40; 63pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Desmarais S, Ford-Hu

The present sequence represents a mutated human apopain (caspase-3) C163S pro-enzyme. The active enzyme containing P17 subunit (Ser29-Asp175) and P12 subunit (Ser176-His277) was engineered for expression using the MetSer29-Asp175 and MetSer176-His277 constructs. The invention provides a method for use in a scintillation proximity binding assay (SPA) for proteases and phosphatases. The method invol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutant human apopain pro-enzyme; caspase-iscintillation proximity binding assay; dia 4-phosphono(difluoromethyl) phenylalanine

The mutation affects the catalytic properties of the enzyme but does not affect their binding properties. The invention claims for new ligands for use in SPA which have increased binding affinity for a tyrosine phosphatase or cysteine protease. The ligands contain at least two 4-phosphono(difluoromethyl) phenylalanine groups which increase binding affinity of the ligand to its respective enzyme. The assay can be used to determine the ability of new ligands and compound mixtures to competitively bind with an enzyme. The method is claimed to allow a better usage of SPA in the discovery of compounds for the content and study of diseases, e.g. diabetes, cancer and
             Judgement of apoptosis-controlling activity for selecting drugs can be used for preventing and treating various diseases caused abnormality in apoptosis control -  \frac{1}{2} 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAB26763;

Nrf2 is a caspase substrate. The method involves detecting cleavage of the Nrf2 protein by caspase in the presence of a candidate drug. Detection of cleavage of the Nrf2 protein by caspase in the presence of a candidate drug indicates apoptosis inducing activity. The method can be used for selecting a drug which can be used for the prevention and the treatment of various diseases caused by abnormality in apoptosis control, such as cancer. The

Such inhibitors can be used to treat Alzheimer's disease, amyotrophic lateral sclerosis (ALS), head trauma or other neurodegenerative disorders in humans (all claimed). Antibodies raised against the protease may be usef dor diagnosis of these disease states, or in their treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                  in an invention relating to novel antisense oligonucleotides (AAS10517-AAS10676) and methods of using these compounds for the modulation of caspase 3 expression. The caspase 3 antisense oligonucleotides specifically hybridise with and inhibit the expression of caspase 3. Antisense compounds targeted to caspase 3 are useful to inhibit caspase 3 expression in cells or tissues and to modulate apoptosis. The caspase 3 antisense oligonucleotides are useful for treating disorders associated with expression of caspase such disorders include hyperprollferative disorders (e.g. cancer) viral infections (e.g. hepatitis), haematopoletic disorders, autoimm

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

-i- FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT PROTECUTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-|-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREEPS) BETWEEN THE BASIC HELIX-LOOPHELIX LEUCINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN.

CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY).

-i- SUBUNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT
                                                                                                                                                                                                                                                                                                                                                                                                                                               EMBL;

Submitted (MAY-1997) to the EMBL/GenBank/DBBJ databases.

11 FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES

RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT PROTEDLYTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-1-GLY-217 BOND. CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 215-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX'LOOP-HELIX LEUCINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN. CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY).

CLEAVES AND ACTIVATES CASPASE-6, -7 AND AN ALA, RELEASING THE MATURE CYTOKINE WHICH IS INVOLVED IN A VARIETY OF INFLAMMATORY PROCESSES.

-1- SUBUNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          P70677; 008668;

FUNCTION: MOST UPSTREAM PROTEASE OF THE ACTIVATION CASCADE OF CASPASES RESPONSIBLE FOR THE FAS-RECEPTOR MEDIATED (CD95) AND THE TO THE ALAPTOR MOLECULE FADD TOWN I INDUCED CELL DEATH. BINDING TO THE ADAPTOR MOLECULE FADD RECRUITS IT TO EITHER RECEPTORS. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS FLICE/MACH PROTEDLYTIC ACTIVATION. THE ACTIVE DIMERIC ENZYME IS THEN LIBERATED FROM THE DISC AND FREE TO ACTIVATE DOWNSTREAM APOPTOTIC PROTEASES. PROTEDLYTIC FRAGMENTS OF THE "TERMINAL PROBEPTIDE (TERMED CAP3, CAP5 AND CAP6) ARE LIKELY RETAINED IN THE DISC. CLEAVES AND ACTIVATES CASPASE-3, -4, -6, -7, -9, AND -10. MAY PARTICIPATE IN THE GRANZYME BAPOPTOTIC PATHWAYS. PROTEOLYTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMARASE (PARF). HYDROLYZES THE SMALL-MOLECULE SUBSTRATE, AC- ASP-GLU-VAL-ASP-1-AMC. LIKELY TARGET FOR THE COMPOX VIRUS CRMA DEATH INHIBITORY PROTEIN.
